Tissue in the bone marrow, for example, contains 1 a cell with a huge, folded, pale-staining nucleus and an enormous cytoplasm, 2 a cell with tiny, dark-staining nucleus, 3 a cell with a horseshoe-shaped nucleus, and 4 even a cell with no nucleus at all! You can view these as almost the protein factories of living organisms.

Having organelles makes eukaryotic cells different from prokaryotic cells. Mitochondria Another kind of organelle found in these types of cells is mitochondria. Cells are the basic building blocks of living things. What happened to the Tasmanian tiger? Cell Junctions 2. By specializing into different types of cells, they are able to perform functions even more efficiently and are able to keep large, multicellular organisms alive.
